This application is a terminal emulator with a modern look and feel and a responsive user interface.

Who Is This App For: This application works great on a smartphone or tablet. It is designed for the iPhone, iPod Touch, and iPad Features: Create, run, and transfer files over SFTP protocol, and SSH.

Configurable, modern look and feel. Lightweight and fast. Separate views for interactive terminal- and file transfers. Split terminal screen in two. Drag and drop files. Search for items. Customize your terminal theme and colors. Configure colors, edit your terminal profile, set a background image, etc. Simple and intuitive menu structure. You can change layouts, colors, fonts, etc. Quick access to your profile. Quick access to an SSH connection. Configurable icon themes. Access to your recently used

SSH connections and parameters. Logic for organization of the data in a host connection. All parameters, every server access, permissions, authorized port-forwarding, connection pool, etc. are available in one place. Sort your data by name and date. A lot of configuration options. Tabbed interface. Custom shortcuts to your commands. Configure keychains for multiple SSH sessions.

Customizable key combo for commands. My favorite feature is the custom keyboard with preset keys in addition to the basic ones. Note: All screenshots are taken from iPhone 6 with iOS 11. How To Download and Install Termius: You can download Termius from the application and install it in your device. Termius

Termius is a modern and responsive tool that turns your Raspberry Pi into a terminal! The program's user interface (UI) and file transfer functionality follows traditional Windows conventions, so it's easy to familiarize yourself with the functionality of a terminal. Add the project to your Pi by running `cd ~/Programs` Then, execute your Pi by running `apt-get install termius` Under the hood This program uses Dokuwiki's Stash extension and the freestyle SQL database. The program is constructed using jQuery. Running this application is equivalent to using a SSH client. You can choose which port you want to use to SSH into each host. Termius still supports the following basic GNU terminal commands: Shell Add a shell to a host by running `telnet [host] [port]` and connecting. delete [files] Delete a given files from a host. logout Log out of a host. open [files] Open a file from a host. quit Quit the program and close the terminal. send [files] Send files from a host to the local machine. stash [files] Stash files from a host. usecase [letters] Change the letter case of a host. View Available Hosts Termius has an impressive list of data available to you. There are three main categories: connections, hosts, and shells. Each one of these is described in detail below. You can even use the various connections in other applications. For instance, you can login to a host using a connection, put the host in a sandbox, and then open terminal in a terminal. Connections Hosts Shells The connections category allows you to connect to hosts through SSH. There is no limit to the number of hosts. When adding a host, the program generates a unique host ID for you. This ID you can refer to in any other category. The hosts category displays various information about your hosts. This includes the name and the IP address of each remote host. The shells category includes basic commands, such as bash, nano, pico, putty, tmux, and xterm. Why not Try Termius? If you don't have a Raspberry Pi, the program has a Mac
