Though designed for 2D drafting, AutoCAD was initially primarily intended for architectural work and design development, although it has since expanded to be used for modeling in other areas, such as mechanical, electrical, civil, and mechanical engineering. Since its release, AutoCAD has been frequently updated and extended. This article describes the basics of using AutoCAD and shows how to create a 2D drawing using basic drawing commands, including line, arc, circle, ellipse, polyline, text, area, and multiline text. It also explains how to add linetypes and

colors and customize the appearance of drawings using styles. The article concludes with a look at drawing objects in 3D and how to import and export drawings and drawings to other applications, as well as to other formats. What is AutoCAD? AutoCAD is a 2D CAD and drafting application. It was developed and marketed by Autodesk. What are the types of drawings in AutoCAD? There are three types of drawings in AutoCAD: line, arc, and polyline. A line drawing is a line on the screen. An arc drawing is an arc or circular line drawn around an object. And a polyline drawing is the lines between points on the screen and used to show contour lines and fill in the

area of an object. In AutoCAD, these drawings are represented by edges and points. The edges connect points on the screen, and the points are the points that make up the line, arc, or polyline. What is an AutoCAD drawing file? An AutoCAD drawing is a file format that contains the information about the lines and arcs and polylines that are used to create the drawing. An AutoCAD drawing file also contains the information that specifies how a particular drawing is to be displayed. The information is used to calculate how a drawing is to be displayed and placed on the screen. The information in a drawing file is organized in a series of blocks. The first three blocks of the drawing file

contain information about the drawing. It includes the name of the drawing and any number of blocks that define the structure of the drawing and what information is contained in the blocks. How do you save an AutoCAD drawing? In AutoCAD, you save a drawing to a file. To save a drawing, select the drawing, and then click File on the menu bar or

1. Field of the Invention
The present invention relates to a disposable diaper and particularly to a disposable diaper for absorbing and containing urine or the like.

2. Description of the Related Art
There has been known a disposable diaper as one of disposable articles which is used for absorbing and containing urine or the like, such as a urine-absorbent article, a diaper, a training pants and an incontinence product. As one of the above disposable diapers, for example, the disposable diaper disclosed in JP-A-10-205497 is known. The disposable diaper disclosed in the publication of Japanese Patent Application Laid-Open No. 10-205497 has a pair of

leg openings formed by a first waist-opening section and a second waist-opening section, a pair of thigh openings formed by a third waist-opening section and a fourth waist-opening section, a front waist-opening section formed between the pair of thigh openings, and a pair of rear waist-opening sections formed by the pair of leg openings. The first waist-opening section has a top portion of a relatively small width. The second waist-opening section has a top portion of a relatively large width. The third waist-opening section is formed between the pair of thigh openings. The fourth waist-opening section is formed between the pair of leg openings. Further, a first waste-collecting section for

receiving and collecting the urine flowing through the pair of leg openings is provided in the first waist-opening section, and a second waste-collecting section for receiving and collecting the urine flowing through the pair of thigh

The present invention relates to a process for producing aldehyde containing polymers. More particularly, it relates to a process for producing aldehyde containing polymers capable of producing high molecular weight polymers,

especially with excellent resistance against heat-resistant enzymes such as lipase, and to the products produced thereby. It is known that the aldehyde groups on the aldehyde-containing polymers may react to give rise to the hydrogen-bonding properties such as hydrophilic properties, and that the aldehyde groups may react with acidic compounds such as salts of organic carboxylic acids to give rise to the ability of the aldehyde-containing polymers to form salts. The aforesaid various properties of the aldehyde-containing polymers depend upon their aldehyde contents and ratios of aldehyde groups to polymer molecular chains. It is also known that the higher the

aldehyde content, the higher is the possibility of forming hydrogen bonds, and the higher the probability of forming salts with acidic compounds. Accordingly, in order to obtain polymers having high molecular weight and also properties as designed, it is desirable that the polymer should contain a high aldehyde content. The aldehyde-containing polymers are generally used as water absorbents, soaps, cosmetics, detergents, surfactants, and the like. However, it is very difficult to produce aldehyde-containing polymers having a high aldehyde content. For example, it is known that a process using an oxidizing agent such as sodium hypochlorite is defective in that the

polymer thus obtained contains residual oxygen. Moreover, when a polymerization is carried out in the presence of acid catalysts such as toluenesulfonic acid, tetraalkylammonium halides and the like, the molecular weight is not increased and the aldehyde content is also lowered. In order to overcome the defects of the known methods for producing aldehyde-containing polymers, the present inventors had previously proposed an improved method comprising polymer
