A: In a nut shell, this tells you what kind of scripting they are doing. Some organisations give access to cron jobs, some do not. With security measures

in place, you would need the organisation's access rights to make sure they can access the script to see what's being called. 1. Field of the Invention This invention relates to

a computer-readable recording medium that stores a virtual storage area managing program and a virtual storage area managing method, and more specifically to a

computer-readable recording medium that stores a virtual storage area managing program and a virtual storage area managing method suitable for recording and

processing a linear unpack area, and a virtual storage area managing program that a computer executes to record and process a linear unpack area. 2. Description of the Related Art The ISA

bus architecture for a personal computer is standardized as follows: 8 bytes of memory address, 16 bytes of memory data, and 8 bytes of memory control data. A memory

address and a memory data area are configured as one area for a real main memory. On the other hand, for the purpose of reducing the installation area of a main memory, a

memory control area is formed in a sub memory. These configuration are performed by the protection technology. Further, it is also possible to store data other than data that are

required to be preserved in a main memory in a sub memory. For example, the following type of method is available: for example, if two or more areas in the main memory are to

be continuously used in this order: a protection area, and a virtual storage area that is called "linear unpack area". In general, in the sub memory, a linear unpack area is used as a region

in which data that are to be continuously used are stored, in an area to be protected as a protection area, and a virtual storage area is used as a region where data that are not

required to be preserved are located (or temporarily stored when a real main memory is replaced with a backup memory), in an area to be protected as a protection area. In

the virtual storage area, a page that is used as a copy source to be used when a real main memory is replaced with a backup memory is stored. Also, if the page that is used as the

copy source is accessed, the real main memory is replaced with a backup memory. When a linear unpack area is used, a replacement to a backup memory is avoided

in page access and access speed is improved. In c6a93da74d
